Subject: Watershed modeling

I was very interested in your Excel spreadsheet models as I have developed similar types of models for various projects. I would like to see how you have incorporated standard eutrophication relationships, etc. However, none of your listed watershed Excel files is downloadable (at least using Microsoft Exchange on my network). I get a message saying the URL was not found. Are they actually on line? I am not so much interested in your particular examples as I am in your "fill in the blanks" generic version (if there is one).

Thanks for putting such good lake modeling stuff out on the net. It looks useful. Are you aware of the EPA BASINS model? (new....available on CD with documentation from EPA). I haven't used it yet but it apparently is a GIS-based nps loading model that predicts nutrient loading.

Thanks in advance for any spreadsheet file you may be able to pass on!
